# Rokz Trade Manager v1.0

A simple trade manager created to make life easier for those with a day job.

Most trade managers I found were super complex and confusing to use. This was created to make life and trading a lot easier. This EA does not need to be run on multiple charts, so long as your trade comment matches your input it will be under control. It supports both 4 and 5 digit brokers, and also the 2 and 3 digit JPY pairs.

Options :-

StopLoss -   In pips, the stoploss you want automatically inserted into a trade opened with the appropriate comment. Can be left blank.

TakeProfit -   In pips, the takeprofit you want automatically inserted into a trade opened with the appropriate comment. Can be left blank.

BreakEven -   In pips, at which profit target do you want the trade manager to shift your stoploss to breakeven.

BreakEvenProf -   In pips, the profit you would like 'banked' when stoploss is moved to breakeven. Used to cover spread or swap.

LotsToClose -   Trade manager will close out this amount of lots when breakeven is triggered.

TradeComment -   Used by the trademanager to differentiate between trades you may or may not want managed.

EmailSLandTP -   You will be emailed every time a new trade with the 'TradeComment' has been opened and it's stoploss and takeprofit modified. Handy for opening trades away from your main PC. Email settings must be set up in MetaTrader4.

EmailUpdates -   You will be emailed for each trade where breakeven has been triggered and the trade manager stepped in. This states your original order open price and your new stoploss.

DisplayHud -   Used for debug purposes, nothing beneficial to trade management.
