

GBPAUD Week 35 (Aug 29 to Sep 2)

Notes:

Looking at last Friday's bounce on the D1 chart from its 10EMA 1.7227 which is contra to the weaker AUDUSD' pro-USD move it would be necessary to keep close eye on both the composite strength of AUDUSD and GBPUSD pairs. Further weakening of AUDUSD can help bring this GBPAUD higher.

Look at the price gap when NY open. Avoid trading until the Tokyo session closes on Monday which happens to be during the London session. UK bank holidays so the London markets will be closed but the European markets will be open. Pay attention to PA setups around PPA at the 50pips grid levels and also at the BRN 1.7400.

Next week, it is 3 trading days till the August month end, avoid starting any new Position Trades this week. Trades should be limited to H1 intraday and also 4H swing trades using the Previous Price Action PPA and using the grid 50-pips price levels for this pair. Be mindful that price can be volatile so small stops of less than 100pips is risky. Use Position building with multiple entries to get good average entry price. Also be prepared to "let profits run" by scale-in trades when market run in favour and when earlier trades are protected with profits.

Average Daily Range 100-days

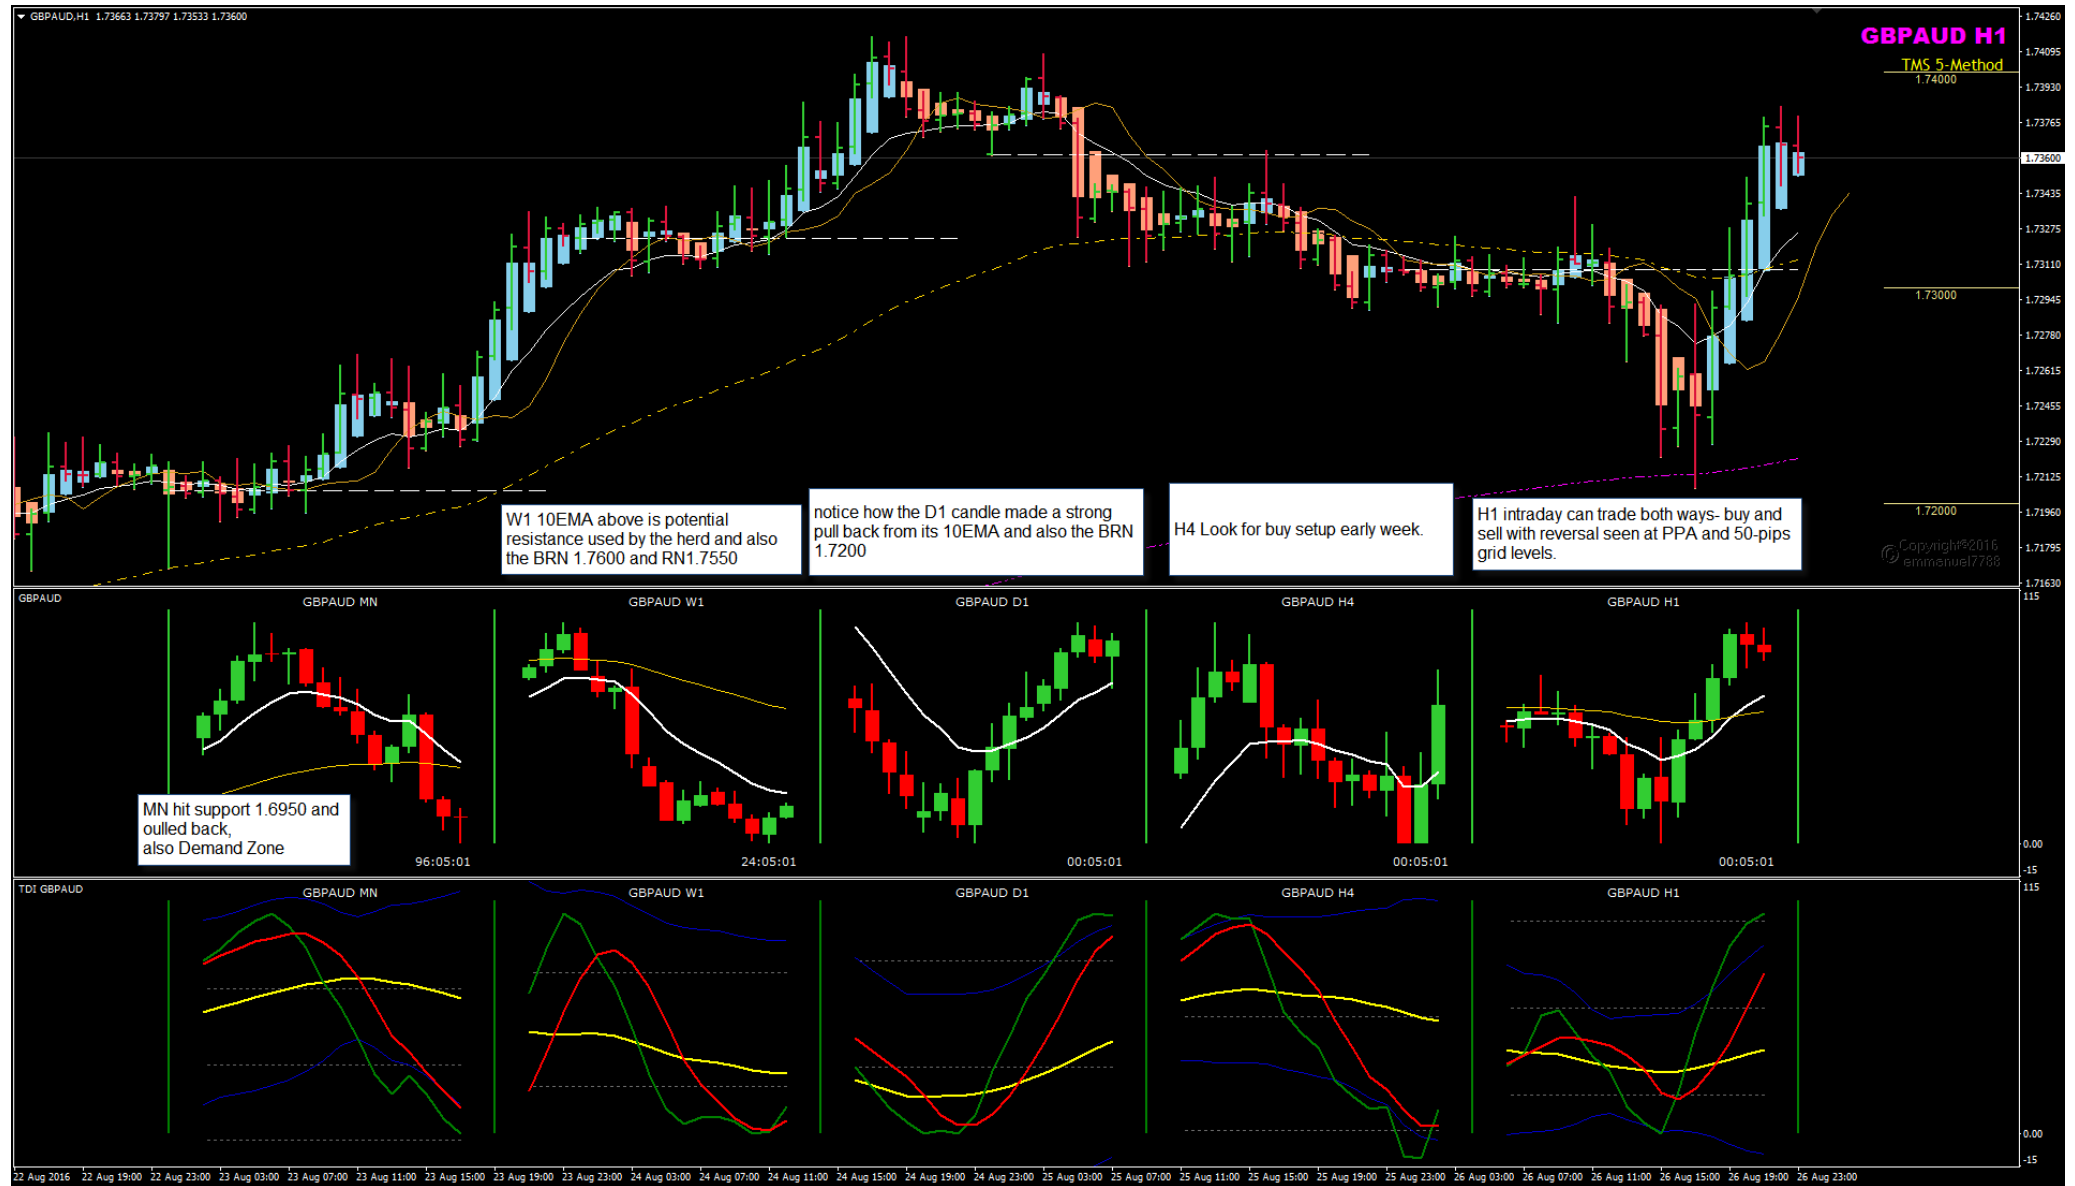

ADR(100) is 230 pips. H1 trade should be short duration 2 to 3 hours when price is volatile. Look for setup at those 50-pips grid price levels.

Average Weekly Range (52 weeks)

The 52-weeks average trading range is 540 pips, a good PA reversal entry on H4 can catch a conservative 60% (250pips) of the swing.

I would consider a buy on Monday with initial Stop Loss below last week's Low @ 1.7130 and using 0.25ADR (~ 55pips) as ME trade distance and maximum 5 trades when price retraces. Risk 0.2% per trade. Tentative final TP is 1.7650.
